Sodium Pertechnetate \((^{99m}\text{Tc})\) Injection

**pH** 6.5 - 7.7

**Purity (1)** Primary aromatic amines—To a volume of Sodium Iotalamate Injection, equivalent to 0.20 g of Iotalamic Acid according to the labeled amount, add 15 mL of water, shake, add 4 mL of a solution of sodium nitrite (1 in 100) under ice-cooling, and proceed as directed in the Purity (2) under Iotalamic Acid: the absorbance is not more than 0.17.

(2) Iodine and iodide—To a volume of Sodium Iotalamate Injection, equivalent to 1.5 g of Iotalamic Acid according to the labeled amount, add 20 mL of water and 5 mL of dilute sulfuric acid, shake well, and filter the precipitate by suction through a glass filter (G4). To the filtrate add 5 mL of toluene, and shake vigorously: the toluene layer is colorless. Then add 2 mL of a solution of sodium nitrite (1 in 100), and shake vigorously: the toluene layer has no more color than the following control solution.

Control solution: Dissolve 0.25 g of potassium iodide in water to make 1000 mL. To 2.0 mL of this solution add 20 mL of water, 5 mL of dilute sulfuric acid, 5 mL of toluene and 2 mL of a solution of sodium nitrite (1 in 100), and shake vigorously.

**Bacterial endotoxins** Less than 3.4 EU/mL.

**Assay** Pipet a volume of Sodium Iotalamate Injection, equivalent to about 4 g of Iotalamic acid \((\text{C}_{12}\text{H}_{23}\text{N}_{2}\text{O}_{4})\), add water to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 200 mL. To exactly 5 mL of this solution add exactly 5 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.4 g of Iotalamic acid for assay, previously dried at 105°C for 4 hours, dissolve in 100 mL of water and 1 mL of sodium hydroxide TS, and add water to make exactly 200 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL. To exactly 5 mL of this solution add exactly 5 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and the standard solution as directed under the Liquid Chromatography according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of Iotalamic acid to that of the internal standard.

\[
\text{Amount (mg) of Iotalamic acid (C}_{12}\text{H}_{23}\text{N}_{2}\text{O}_{4}) = \frac{\text{amount (mg) of Iotalamic acid for assay}}{Q_T} \times Q_S
\]

**Internal standard solution**—A solution of L-tryptophan in the mobile phase (3 in 2500).

**Operating conditions**—

- **Detector:** An ultraviolet absorption photometer (wavelength: 240 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
- **Column temperature:** A constant temperature of about 20°C.
- **Mobile phase:** To 3.9 g of phosphoric acid and 2.8 mL of triethylamine add water to make 2000 mL. To this solution add 100 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of Iotalamic acid is about 6 minutes.

**System suitability**—

- **System performance:** When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, Iotalamic acid and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
- **System repeatability:** When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of Iotalamic acid to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers, and colored containers may be used. Storage—Light-resistant.

---

**Sodium Picosulfate**

\(\text{ピコスルファートナトリウム}\)

\[
\text{Na}_2\text{SO}_4\cdot\text{C}_{18}\text{H}_{12}\text{N}_2\text{O}_5\text{S}_2\cdot\text{H}_2\text{O} : 499.42
\]

Disodium 4,4'-(pyridin-2-ylmethylenebis(phenyl sulfone) monohydrate \([10040-45-6, \text{anhydride}]

Sodium Picosulfate contains not less than 98.5% of \(\text{C}_{18}\text{H}_{12}\text{N}_2\text{O}_5\text{S}_2\) (mol. wt.: 481.41), calculated on the anhydrous basis.

**Description** Sodium Picosulfate occurs as a white, crystalline powder. It is odorless and tasteless.

It is very soluble in water, soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in diethyl ether.
